# How to Clean Student Data and Use Claude for Classroom Analysis

## 1. Clean the student data before uploading it 0:00

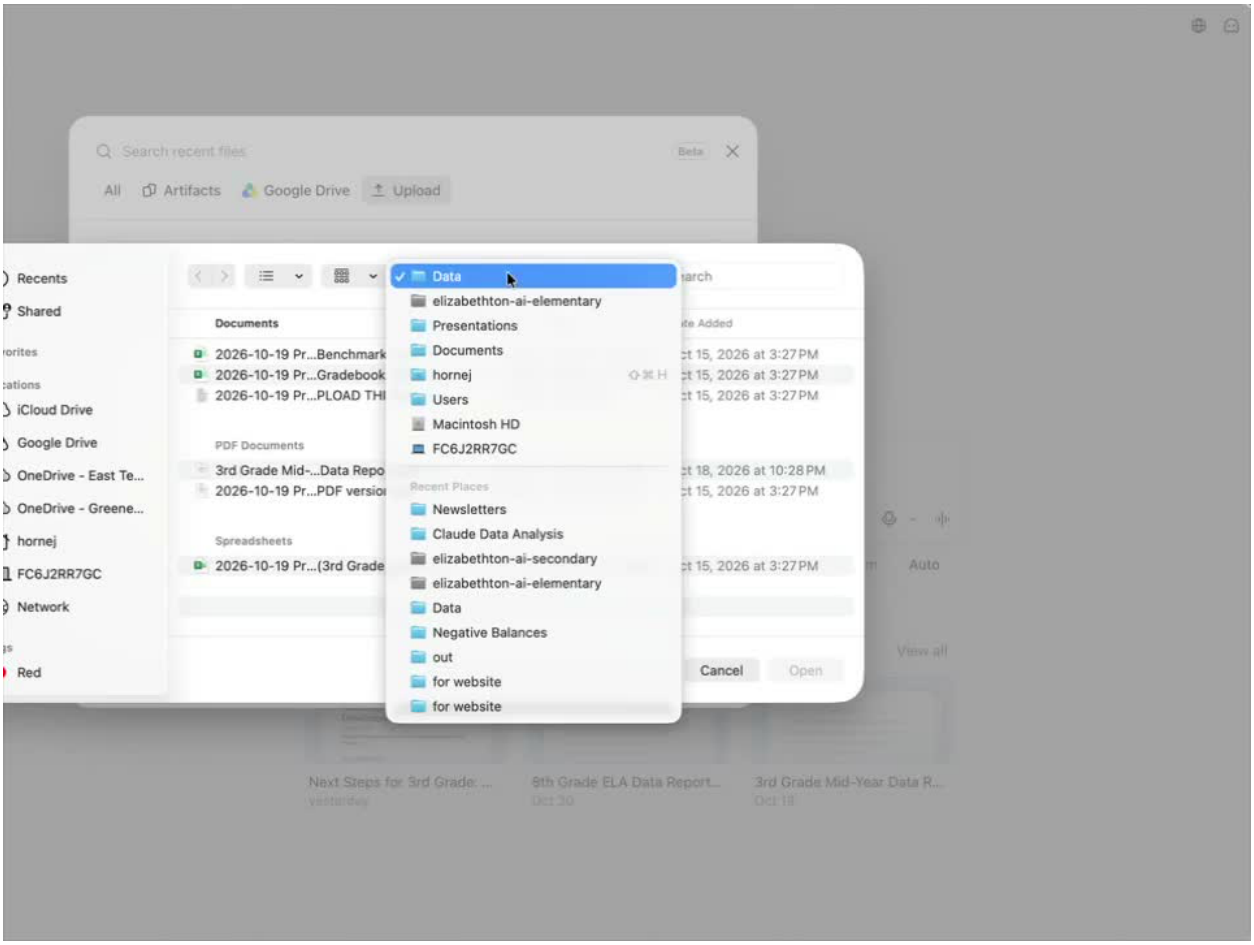

- Start by removing student names from the dataset for privacy.
- Replace names with a consistent identifier system, such as:
    - student 1
    - student 2
    - etc.
- Create a simple “Rosetta Stone” mapping so you can match real students to their anonymized IDs later.
- Sort the data by last name to make the renaming process easier and more consistent.

## 2. Create a cleaned version of each file 0:38

- Add a new column for the anonymized student label.
- Use fill-down or double-click autofill to quickly assign student numbers to all rows.
- Delete or hide the original name columns after the replacement is complete.
- Save the cleaned file under a new name, such as:
    - cleaned practice data
- Repeat the same process for every file you plan to analyze so the student IDs match across files.

## 3. Upload the cleaned files into Claude 2:14

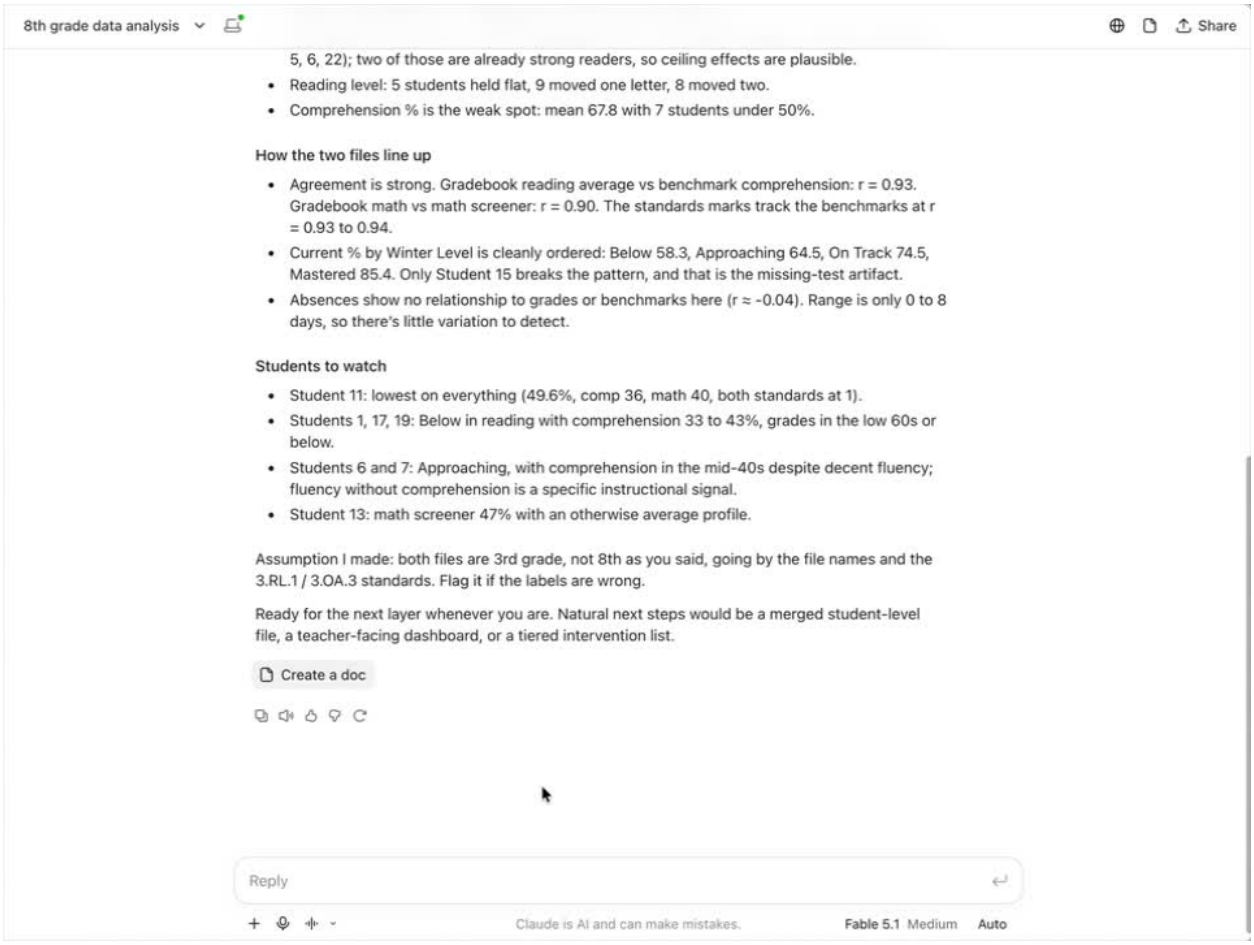

- Upload both cleaned datasets into Claude.
- In the example, the speaker uses two 8th-grade files:
    - a benchmark file
    - a gradebook file
- Tell Claude what the files are and what you want it to do.
- Example prompt:
    - “I have two 8th grade files. One is a benchmark file and one is a gradebook file. I need basic analysis of these.”

## 4. Review the initial data analysis 2:59

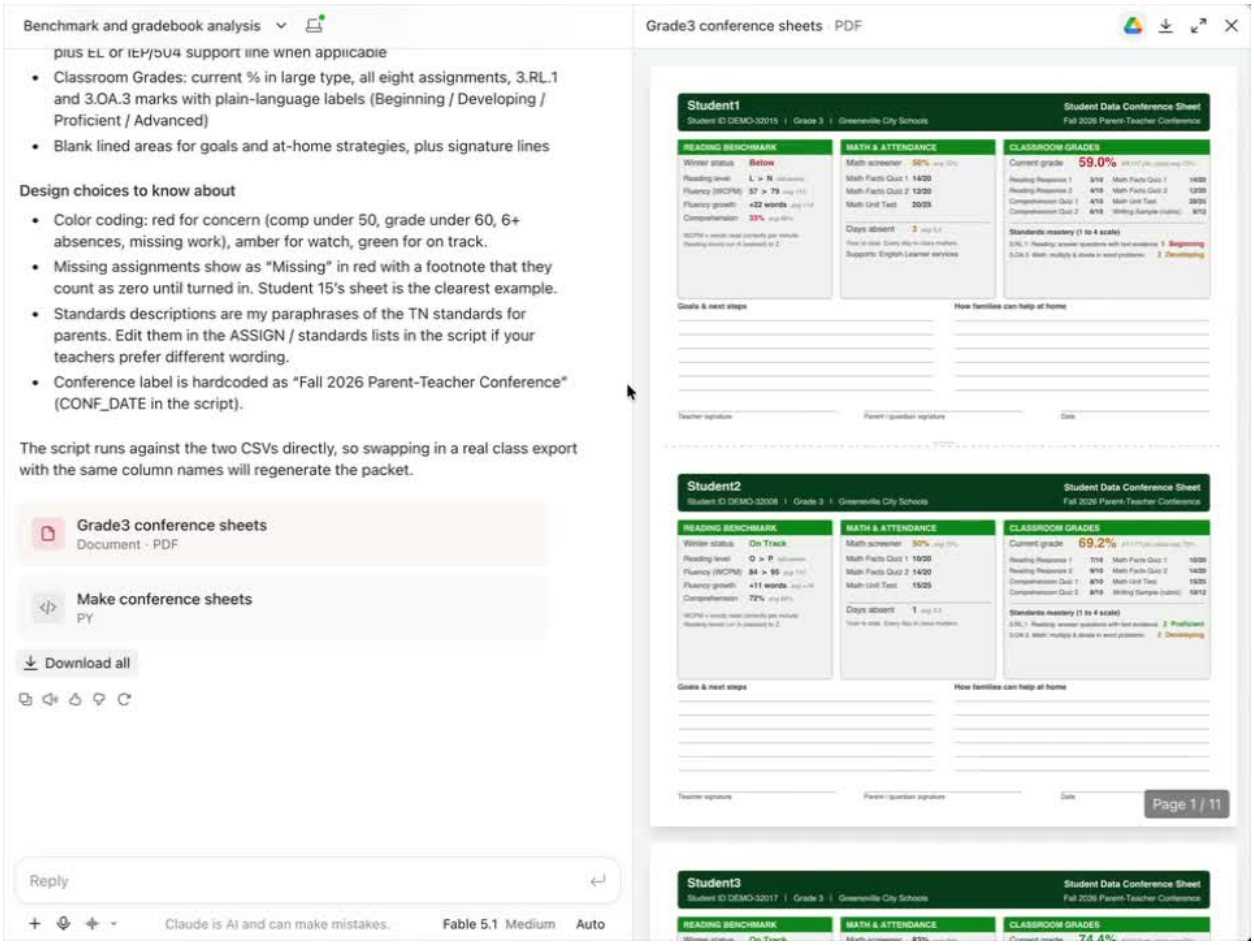

- Claude generates a basic summary of the data.
- It can identify issues such as:
    - missing assignments
    - low-performing students
    - how the benchmark and gradebook data align
- Use this first pass to get a quick class overview and spot students who may need attention.
- You can also turn this output into a document for later use.

## 5. Generate parent-teacher conference half sheets 3:23

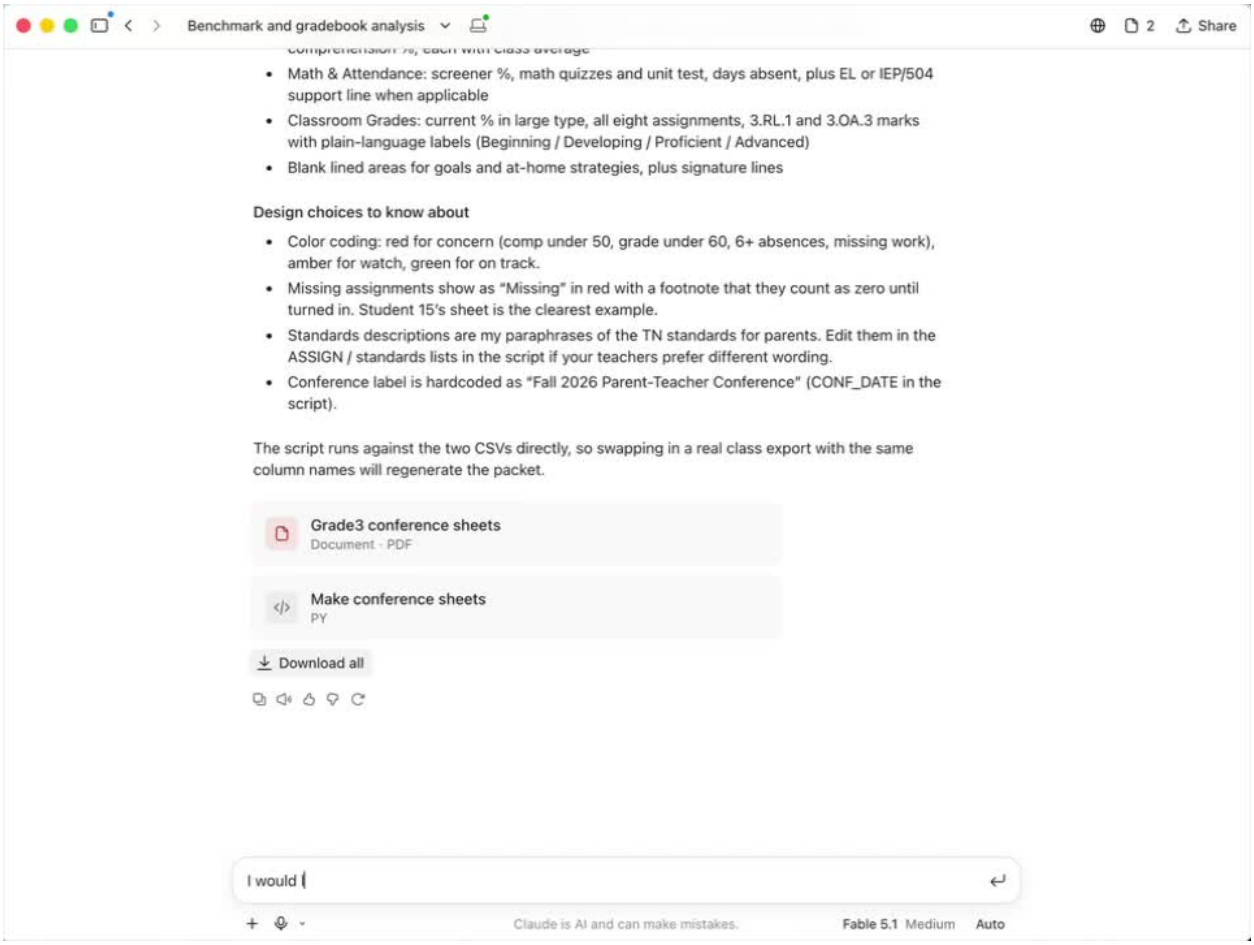

- Ask Claude to turn the data into printable conference sheets.
- Example prompt:
    - “Can you use this data to create parent-teacher conference half sheets or sheets for me to print?”
- Ask for a format that looks like a data conference sheet.
- Include the fields you want, such as:
    - attendance
    - grades
    - benchmark scores
- Claude can produce individualized sheets for each student in a few minutes.

## 6. Use the output to support conferences and student conversations 4:20

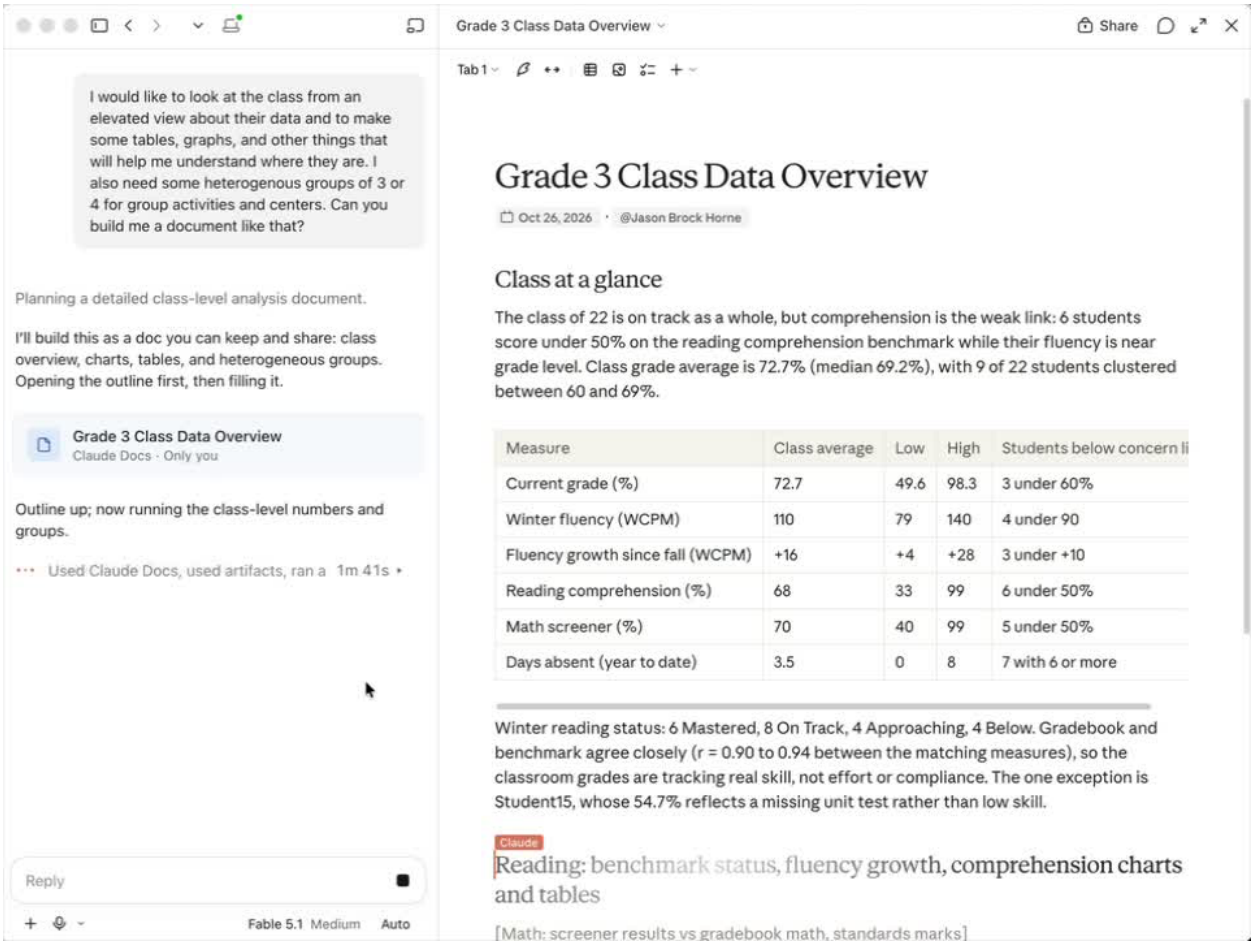

- The generated sheets can include:
    - student ID
    - reading benchmark
    - math benchmark
    - attendance
    - classroom grades
- These sheets save time compared with building them manually or using mail merge.
- They can be shared or exported, making them useful for parent conferences and student support meetings.

## 7. Ask for a class-wide overview with charts and grouping suggestions 5:01

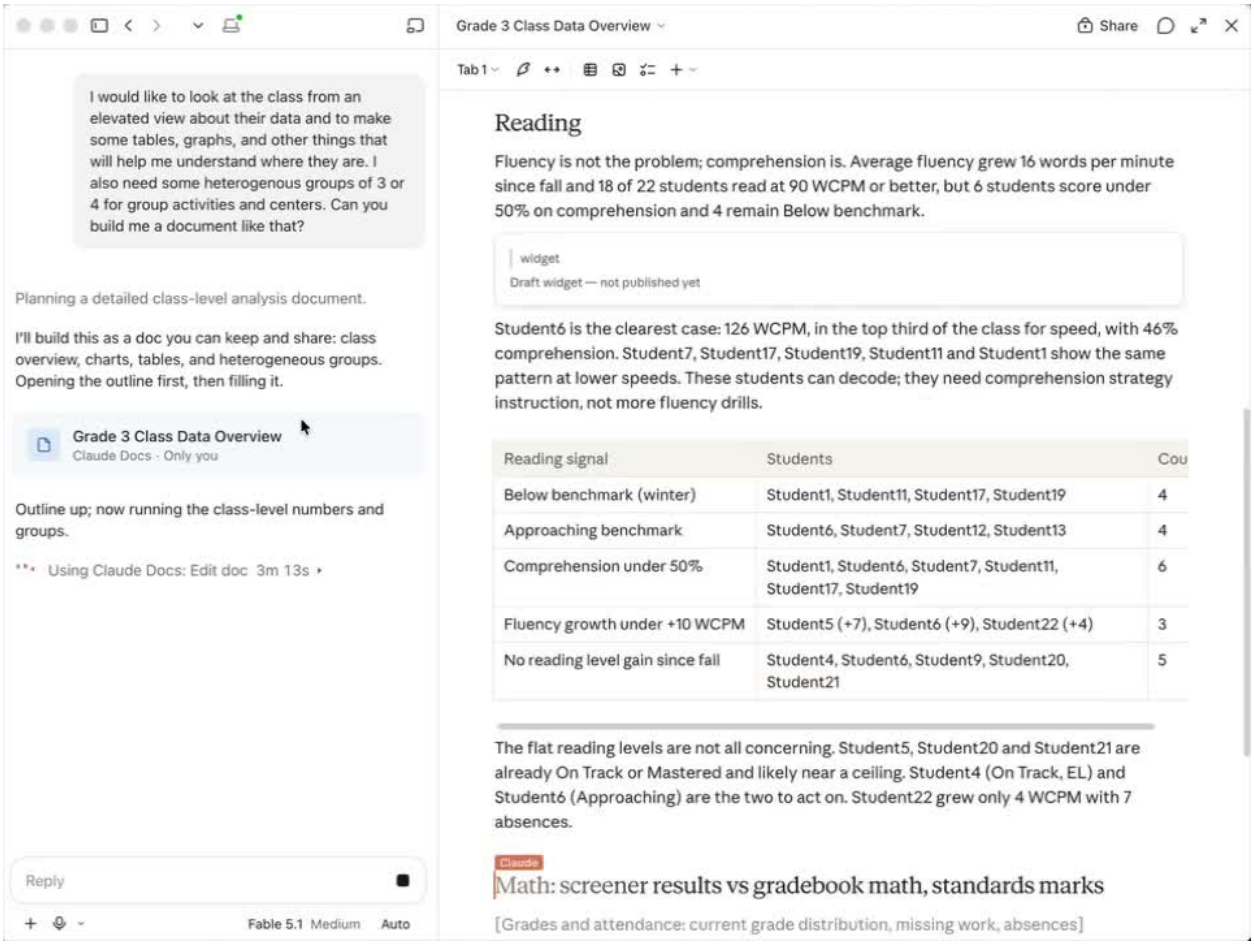

- Prompt Claude to give you a higher-level view of the class.
- Example prompt:
    - "I would like to look at the class from an elevated view and make some tables, graphs, and other things that will help me understand where they are."
- Also ask for heterogeneous groups of 3–4 students for centers or group work.
- Claude can build a document that includes both analysis and grouping recommendations.

## 8. Interpret the class analysis and correlations 6:01

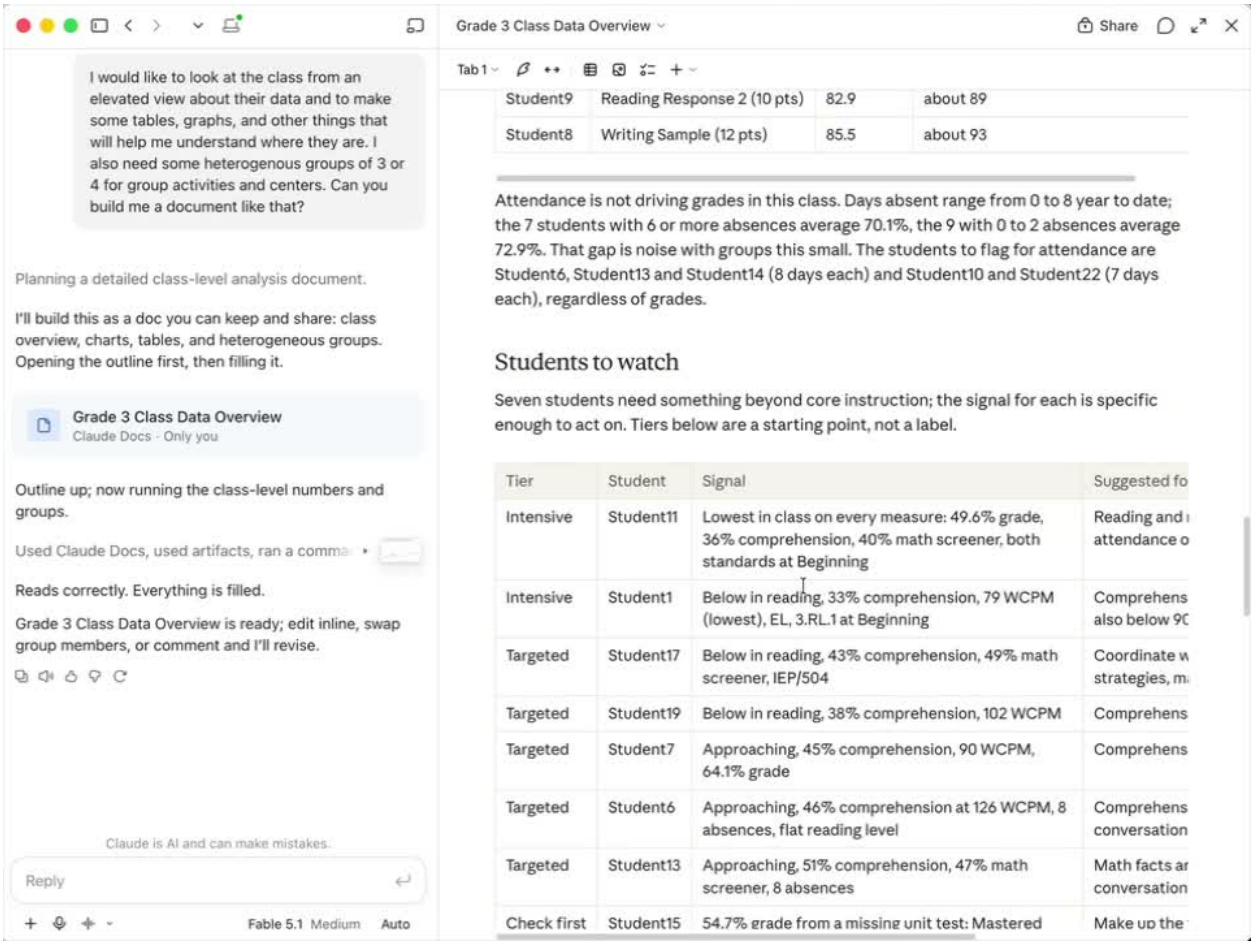

- Claude may produce a class-at-a-glance table with averages and trends.
- It can also show correlations between variables such as:
    - reading status
    - math screener scores
    - days absent
- The transcript explains that:
    - R values closer to 1 indicate stronger positive correlation
    - values above .5 are fairly strong
    - values above .8 are very strong
    - values near 0 show little correlation
    - negative values indicate negative correlation

## 9. Use the deeper analysis to identify students to watch 6:53

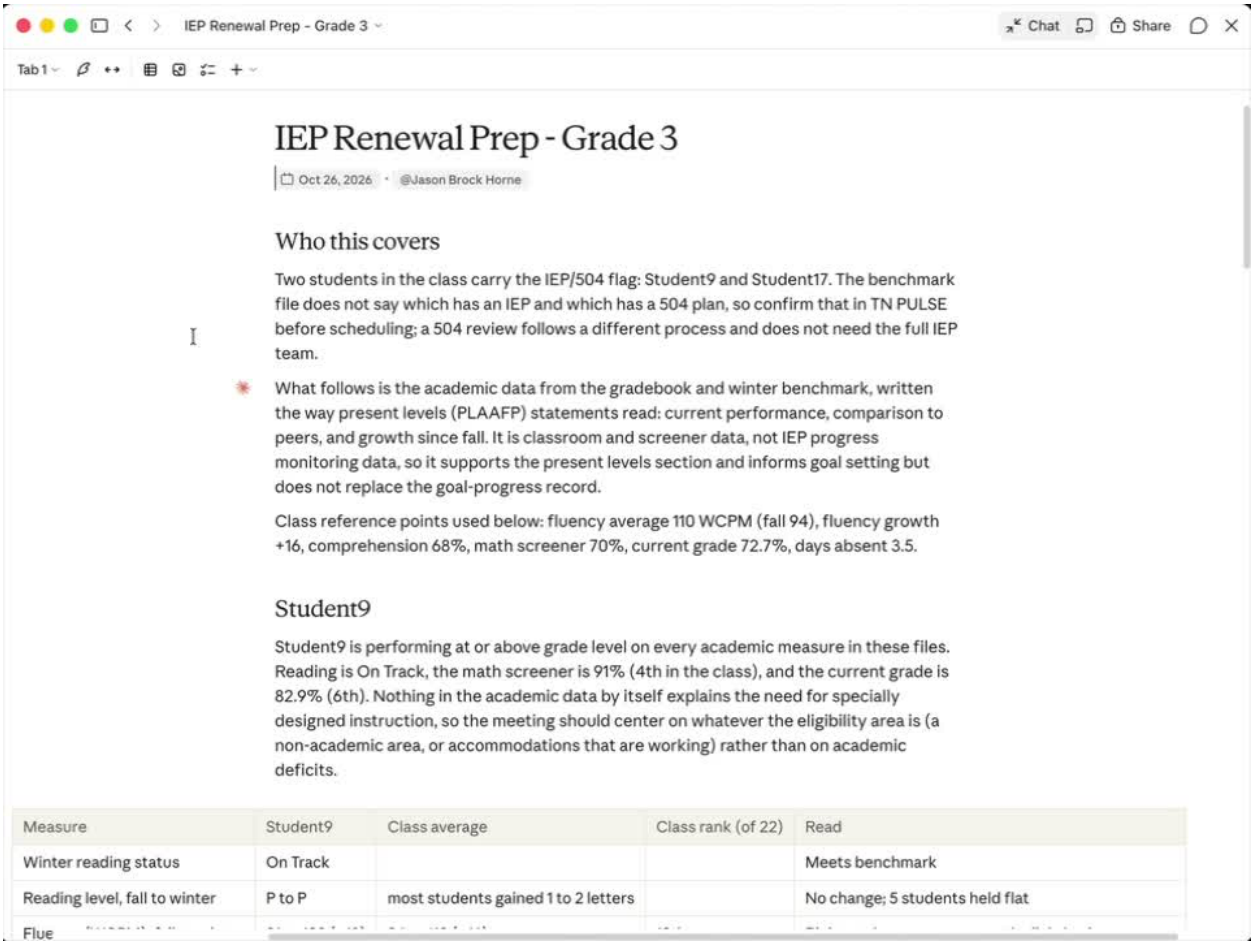

- Claude can compare different measures, such as:
    - fluency vs. comprehension
    - math spread and consistency
    - grades vs. attendance
- It may generate scatterplots and highlight specific students who need attention.
- In the example, student 6 is flagged as a student to review.
- The output also includes suggested groups and a full student data table.

## 10. Prepare for IEP renewals using the same data 8:32

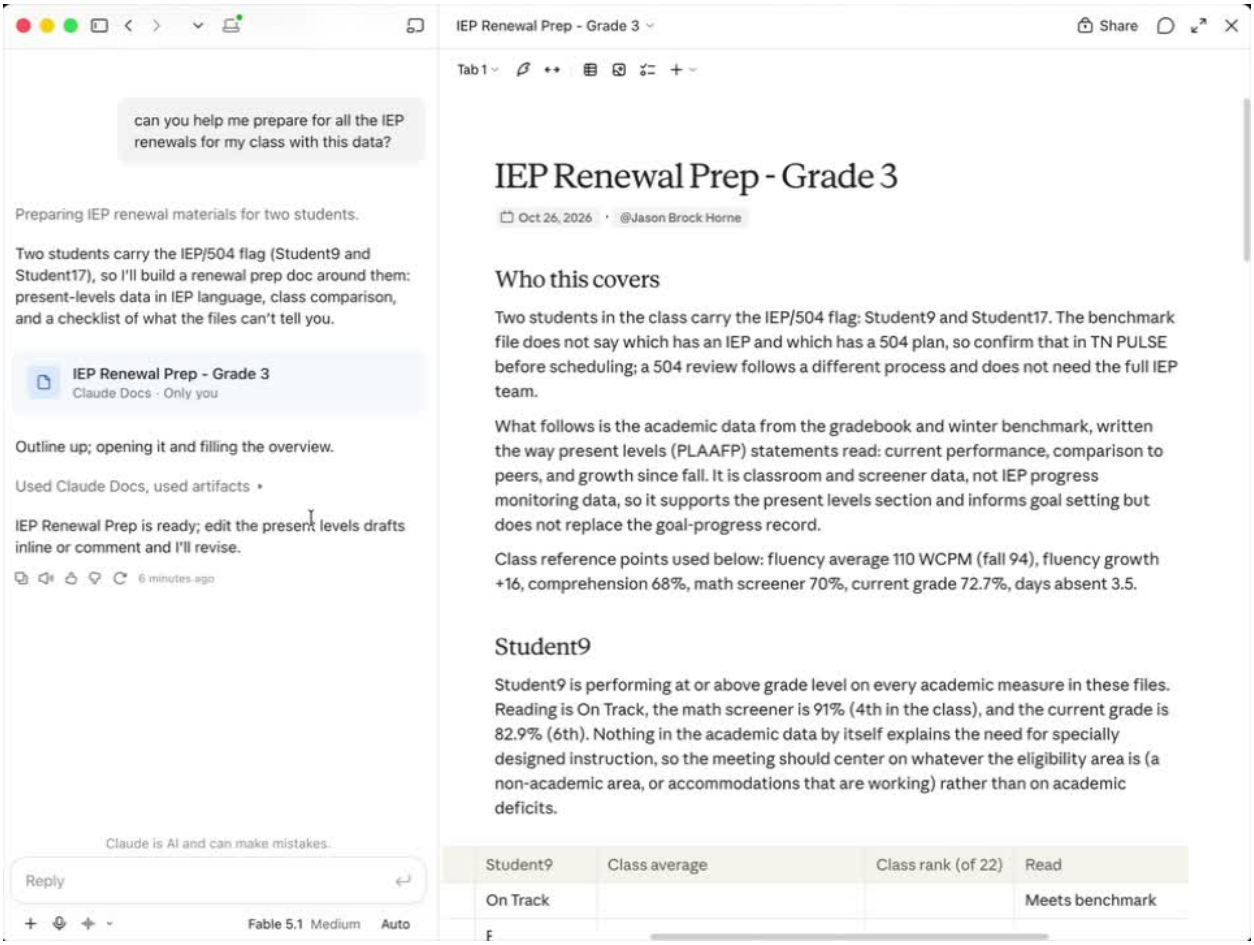

- Ask Claude to help prepare for IEP renewals.
- It can generate:
    - student narratives
    - comparison to class performance
    - meeting talking points
- This gives you a starting point for renewal meetings and helps organize student-specific information.
- You can export the results to PDF or continue refining the document.

## 11. Keep your student ID system consistent for future uploads 9:34

- When new data comes in, make sure the anonymized student numbers stay consistent.
- If a student is new, assign them the next available number and keep that mapping updated.
- As long as the student IDs match across files, you can keep reusing the workflow with new datasets.
- If the structure changes too much, restart with a fresh cleaned version of the data.

## 12. Save time and use the output to focus on students 10:10

- The speaker emphasizes that this process does not take a full planning period.
- The main benefit is saving time on high-level data work so you can focus more on working directly with students.
- The final outputs can be shared, exported, and reused for multiple teacher tasks.
- The video closes by offering ongoing help and future examples in a newsletter.
